

Report

Matthew Frommeyer & Colin McDonough

Our Program works as intended except for a few errors. Also if the user enters a query with an error, the answer will be 0.0 as it sets it back to a default value after running the thread which should change the text to “Syntax Error” for 1 second then change it back. We decided the user will have to click the textbox to start inputting the query by keyboard but that's no different from how most calculators on computers work and is easily implemented. Other than that everything works and all of the functionality requested works in the program as intended.
